

# NSTP REFLECTIVE JOURNAL

Name: Hakuryu Acosta Kato

Year and Course: BSCS-201

Week No.: 1

Name of Activity: Barangay viewing

Date Conducted: march 12, 2025

Assigned Barangay: Barangay 75- Zone 10

## D-1: BARANGAY VIEWING

During the barangay viewing. The first thing that I reflected and seen during this day was finding bunch of trash and litter in the streets therefore creating this putrid smell in these streets thus making it hard to focus on other problems in the barangay and making the whole class seeing that the main problem of the barangay is it's constant problem of the litter. When reflecting on this situation, I noticed that their were few trash bins in the area causing people to throw their trash in the ground. The lack of options to throw their garbage in a trash bin can cause major impact to the environment and well-being of the

community

Another thing that I observe during the barangay viewing is how small and compacted the streets are and how it is easy to cause havoc in the area that can cause traffic jams that are led by road blockage, accident and many more. But the main concern that I saw is how prone it is to create a hazardous area that could cause a lot of problems to the community and may harm the children of the community. The thing that I observe about the community is the social dynamic of the people. They were curious and enthusiastic about what the whole class will do for the community and learn new techniques to futher improve their barangay

Lastly the most interesting thing that I observe is how the community is getting some improvement of their commerical areas and how it's getting more of a modern urbanization progress. Which is very good for the barangay, but I notice some problems in these sites. During the observation I saw how debris and materials are all over the place outside the construction sites. Its not life threatening but a clean area can really brighten the mood of the zones. But I can also give them credit that they always warn the people of the community to have a distance in the construction sites
